Several isolated singularities of f(z) inside Γ

MA3614 2024/5 Week 25, Page 1 of 20

Earlier results with 0 or 1 isolated singularities

Week 18: Cauchy-Goursat theorem: If f is analytic in a simply connected domain D and Γ is any loop (i.e. a closed contour) in D then

$$\oint_{\Gamma} f(z) \, \mathrm{d}z = 0.$$

No singularities inside Γ .

Week 18: The generalised Cauchy integral formula:

If f is analytic in a simply connected domain D and Γ is any loop and z_0 is inside Γ then

$$\frac{f^{(m)}(z_0)}{m!} = \frac{1}{2\pi i} \oint_{\Gamma} \frac{f(z)}{(z-z_0)^{m+1}} dz, \quad m=0,1,2,\ldots$$

1 singularity inside Γ .

The Residue Theorem

If z_1, z_2, \ldots, z_n are isolated singularities inside Γ and C_1, C_2, \ldots, C_n are non-intersecting circles traversed once in the anti-clockwise direction then $\Gamma \cup (-C_1) \cup \cdots \cup (-C_n)$ is the boundary of a region in which f(z) is analytic and

$$\oint_{\Gamma} f(z) dz = \sum_{k=1}^{n} \oint_{C_{k}} f(z) dz$$

$$= 2\pi i \sum_{k=1}^{n} \operatorname{Res}(f, z_{k}).$$

With the knowledge of Laurent series to describe the behaviour of f(z) in the vicinity of each point z_k we get the above result.

MA3614 2024/5 Week 25, Page 2 of 20

The earlier results as a special case of the Residue Theorem

$$\oint_{\Gamma} f(z) dz = 2\pi i \sum_{k=1}^{n} \operatorname{Res}(f, z_k).$$

- When f(z) is analytic inside Γ we have no isolated singularities inside Γ, i.e. n = 0.
- ▶ When n = 1 and we have a pole at z_1 of order m

$$\operatorname{Res}(g, z_1) = \frac{f^{(m)}(z_1)}{m!}, \quad \text{when } g(z) = \frac{f(z)}{(z - z_1)^{(m+1)}}.$$

The earlier results were of course needed to establish the residue theorem result.

Techniques to calculate the residue

In the case of a **simple pole** of f(z) at z_0 most examples for calculating the residue have involved calculating the limit

$$Res(f, z_0) = \lim_{z \to z_0} (z - z_0) f(z).$$

In many of the examples L'Hopital's rule has been used.

More generally when we have a **pole of order** $m \ge 1$ we can calculate the residue by using

$$\operatorname{Res}(f, z_0) = \frac{1}{(m-1)!} \lim_{z \to z_0} \frac{\mathrm{d}^{m-1}}{\mathrm{d}z^{m-1}} \left((z - z_0)^m f(z) \right).$$

We need to know the order of the pole to use the above. It is sometimes possible to simplify the expression for $(z - z_0)^m f(z)$ before differentiation is done.

MA3614 2024/5 Week 25, Page 5 of 20

Examples in the lectures

In week 24.

$$\int_{-\infty}^{\infty} \frac{\mathrm{d}x}{x^2 + 2x + 2} = \pi.$$

$$I = \int_{-\infty}^{\infty} \frac{1}{x^4 + 16} dx = \frac{\pi\sqrt{2}}{16}.$$

In week 25 (this week). Let a > 0.

$$\int_{-\infty}^{\infty} \frac{e^{iax}}{1+x^2} dx = \pi e^{-a}.$$

$$\int_{-\infty}^{\infty} \frac{x \sin(x)}{1+x^2} dx = \pi e^{-1}.$$

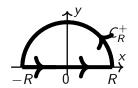

The last example will need Jordan's lemma to justify that the contribution from C_R^+ tends to 0 as $R \to \infty$.

MA3614 2024/5 Week 25, Page 7 of 20

Integrals on $(-\infty, \infty)$ evaluated using residue theory

With P(z) and Q(z) being polynomials we consider

$$f(z) = \frac{P(z)}{Q(z)}$$
 (week 24) and $f(z) = \frac{P(z)}{Q(z)}e^{imz}$. (week 25)

Suppose that f(z) has poles at points z_1, \ldots, z_n in the upper half plane. Suppose that Q(z) has no zeros on the real axis.

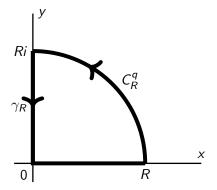

With $\Gamma_R = [-R, R] \cup C_R^+$ denoting the closed contour

$$\oint_{\Gamma_R} f(z) \, dz = \int_{-R}^R f(x) \, dx + \int_{C_R^+} f(z) \, dz = 2\pi i \sum_{k=1}^n \text{Res}(f, z_k).$$

When the integral involving C_R^+ tends to 0 as $R \to \infty$ we get

$$\int_{-\infty}^{\infty} f(x) dx \quad \text{or} \quad \text{p.v.} \int_{-\infty}^{\infty} f(x) dx = \lim_{R \to \infty} \int_{-R}^{R} f(x) dx.$$
MA3614 2024/5 Week 25, Page 6 of 20

Other loops in the exercises

$$f(z) = \frac{1}{z^4 + 16}$$

has one simple pole at $z_1 = 2e^{\pi i/4}$ inside this loop when R > 2. With an upper half circle instead as the loop we have 2 simple poles inside the loop at z_1 and $z_2 = 2e^{3\pi i/4}$.

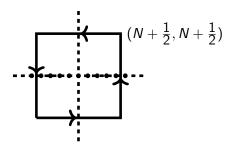

MA3614 2024/5 Week 25, Page 8 of 20

A square as a loop in the exercises

In the context of the sum of a series

$$\sum_{n=1}^{N} f(n), \quad f(z) \text{ being even,}$$

the following loop Γ_N , which is a square, is used.

This has length $L_N=4(2N+1)$. $M_N=\max\{|f(z)|:z\in\Gamma_N\}$. We need $M_NL_N\to 0$ as $N\to\infty$. MA3614 2024/5 Week 25, Page 9 of 20

A sufficient condition for the C_R^+ part to tend to 0

In week 24 we proved the following

Suppose that f(z) is a rational function of the form

$$f(z) = \frac{P(z)}{Q(z)},$$

with

$$P(z) = a_p z^p + \dots + a_1 z + a_0,$$

$$Q(z) = b_q z^q + \dots + b_1 z + b_0$$

where $a_p \neq 0$, $b_q \neq 0$. When |z| = R is large

$$|f(z)| = \mathcal{O}\left(R^{p-q}\right) = \mathcal{O}\left(\frac{1}{R^{q-p}}\right).$$

 $RM_R \to 0$ as $R \to \infty$ when $q - p \ge 2$, i.e. $q \ge p + 2$.

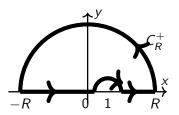

MA3614 2024/5 Week 25. Page 11 of 20

Singularities on ${\mathbb R}$ and Cauchy principal values

In the lectures and in the exercises of this week and next week we will also consider integrals of the form

$$\int_{-\infty}^{\infty} f(x) \, \mathrm{d}x$$

when f(x) has poles on the real axis. The integrals need to be considered in a principal valued sense. In the case of a singularity at 1 the indented contour is illustrated below.

The knowledge of the Laurent series enables us to determine the contribution from the smaller half circle.

MA3614 2024/5 Week 25, Page 10 of 20

The integrals on C_R^+ when we have a e^{imz} term

With z = x + iy, imz = -my + imx, $e^{imz} = e^{-my}e^{imx}$. When m > 0, $|e^{imz}| = e^{-my} \le 1$ when $y \ge 0$.

When $deg(Q) \ge deg(P) + 2$ we have

$$\int_{C_{c}^{+}} rac{P(z)}{Q(z)} \, \mathrm{d}z o 0$$
 and $\int_{C_{c}^{+}} rac{P(z)}{Q(z)} \mathrm{e}^{imz} \, \mathrm{d}z o 0$

as $R \to \infty$ by using the ML inequality.

When deg(Q) = deg(P) + 1 Jordan's lemma also gives

$$\int_{C_p^+} \frac{P(z)}{Q(z)} e^{imz} dz \to 0$$

as $R \to \infty$.

Jordan lemma comments

When $\deg(Q) = \deg(P) + 1$ there is a constant $A \ge 0$ such that for part of the integrand

$$\left|\frac{P(Re^{i\theta})iRe^{i\theta}}{Q(Re^{i\theta})}\right| \leq A, \quad \text{for sufficiently large } R.$$

Much of the detail is showing that for the other part to be considered

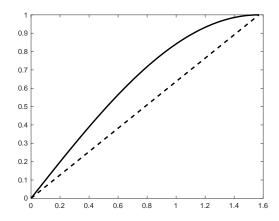

$$\int_0^{\pi} \exp(-mR\sin\theta) \, \mathrm{d}\theta \to 0 \quad \text{as } R \to \infty.$$

Firstly, $sin(\theta) = sin(\pi - \theta)$ and

$$\int_0^{\pi} \exp(-mR\sin\theta) d\theta = 2 \int_0^{\pi/2} \exp(-mR\sin\theta) d\theta.$$

MA3614 2024/5 Week 25, Page 13 of 20

A lower bound for $sin(\theta)$ on $[0, \pi/2]$

 $sin(\theta)$ is above the linear interpolant using x = 0, $x = \pi/2$.

$$\sin(\theta) \geq \frac{2}{\pi}\theta$$
.

MA3614 2024/5 Week 25, Page 15 of 20

Graphs of $\exp(-mR\sin(\theta))$, mR = 1, 2 and 4

The value is 1 at $\theta = 0$ and $\theta = \pi$ but small in the middle part.

MA3614 2024/5 Week 25, Page 14 of 20

Jordan's lemma, completing the detail

$$\sin(\theta) \ge \frac{2}{\pi}\theta, \quad 0 \le \theta \le \frac{\pi}{2}.$$
 $\exp(-mR\sin(\theta)) \le \exp(-k\theta), \quad \text{with } k = \frac{2mR}{\pi}.$

$$\int_0^{\pi/2} \exp(-mR\sin\theta) \, \mathrm{d}\theta \leq \int_0^{\pi/2} \exp(-k\theta) \, \mathrm{d}\theta$$

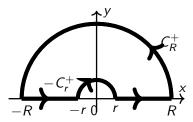

$$\leq \int_0^{\infty} \exp(-k\theta) \, \mathrm{d}\theta = \frac{1}{k} \to 0 \quad \text{as } R \to \infty.$$

Singularities on $\mathbb R$ and Cauchy principal values

Suppose f(z) has a simple pole on \mathbb{R} and we want to evaluate

$$\int_{-\infty}^{\infty} f(x) \, \mathrm{d}x.$$

The integrals need to be considered in a principal valued sense. In the case of a pole at z=0 we need an indented contour as illustrated below.

The knowledge of the Laurent series enables us to determine the contribution from the smaller half circle. MA3614 2024/5 Week 25, Page 17 of 20

The C_r^+ contribution as $r \to 0$

When f(z) has a simple pole at 0 it has a Laurent series of the following form for z sufficiently close to 0.

$$f(z) = \frac{a_{-1}}{z} + g(z)$$
 where $g(z)$ =analytic function.

$$\int_{C_r^+} f(z) dz = a_{-1} \int_{C_r^+} \frac{dz}{z} + \int_{C_r^+} g(z) dz.$$

 $z(\theta) = re^{i\theta}$, $0 \le \theta \le \pi$ describes C_r^+ and the length of C_r^+ is πr .

$$\int_{C_r^+} \frac{\mathrm{d}z}{z} = \int_0^\pi \frac{i r \mathrm{e}^{i\theta}}{r \mathrm{e}^{i\theta}} \, \mathrm{d}\theta = i \int_0^\pi \, \mathrm{d}\theta = \pi i.$$

As a function g(z) analytic on and near C_r^+ it is bounded and there exists K such that $|g(z)| \le K$ in the region. (K = 2|g(0)| will do if $g(0) \ne 0$ when r is sufficiently small.) Using the ML inequality we have

$$\left| \int_{C_r^+} g(z) \, \mathrm{d}z \right| \le K\pi r \to 0 \quad \text{as } r \to 0. \quad \lim_{r \to 0} \int_{C_r^+} f(z) \, \mathrm{d}z = \pi i \mathrm{Res}(f, 0).$$

$$\frac{1}{K} \frac{1}{K} \frac{1$$

The principal value for a singularity on $\mathbb R$

When we have a singularity of f(z) at $x_0 \in [-R, R]$ the principal value means

p.v.
$$\int_{-R}^{R} f(x) dx = \lim_{r \to 0} \left(\int_{-R}^{x_0 - r} f(x) dx + \int_{x_0 + r}^{R} f(x) dx \right)$$

In the above the part of the real line can be described as $[-R, R] \setminus (x_0 - r, x_0 + r)$. The part of [-R, R] that we are excluding has x_0 exactly in the middle.

MA3614 2024/5 Week 25, Page 18 of 20

Examples which use indented contours

We show the following.

$$I_1 = \int_{-\infty}^{\infty} \frac{\sin(x)}{x} dx = \pi, \quad I_2 = \int_{-\infty}^{\infty} \frac{\sin^2(x)}{x^2} dx = \pi.$$

We do these by using an indented contour and the following expressions.

$$I_1 = \operatorname{Im} \left\{ \operatorname{p.v} \int_{-\infty}^{\infty} \frac{\operatorname{e}^{ix}}{x} \, \mathrm{d}x \right\}.$$

$$I_2 = \operatorname{Re}\left\{\operatorname{p.v}\int_{-\infty}^{\infty} \frac{1 - \operatorname{e}^{2ix}}{2x^2} \, \mathrm{d}x\right\}.$$

 I_1 and I_2 exist in the usual sense, it is just intermediate quantities which need the principal value meaning.

MA3614 2024/5 Week 25, Page 20 of 20
